

Paradise Hotel Client Documentation

Student Id: 2420073

Instructor: Prof. Kazakov

Date: 5/25/2025

Description

The goal of this project is to develop a visually appealing and functional frontend that is focused on hotel booking and management. The application allows users to perform common actions such as registering an account, searching for hotels and rooms, and managing reservations.

The main focus as mentioned before is mostly on the development of the frontend experience. The instructor has provided a backend API and the frontend is supposed to consume and interact with the data provided by that particular API. The frontend will communicate with the backend through HTTP requests, essentially setting up a fullstack application.

Running the Project

1. Go to the backend directory and type the following command in the terminal: “npm run dev”
2. Now once the backend is running, navigate to the frontend directory and type the same command in a different terminal: “npm run dev”

Important Notes

- The backend should be running before the frontend. If the frontend is running before the backend, then it won't be able to make requests.
- Make sure that the frontend can communicate with the backend through HTTP requests. It's important to use Axios, to ensure that there is an HTTP client instance that can communicate with the backend, on the port that it is running on.
- The backend must have CORS (Cross-Origin Resource Sharing) enabled in order to allow cross-origin requests.
